

Assignment 3

1. Explain the role of standard mathematical functions in C programming. Provide examples of commonly used mathematical functions and illustrate their usage in solving numerical problems.
2. Discuss the differences between **getch()**, **getche()**, **getchar()**, and **gets()** functions in C. Highlight their respective functionalities and provide examples demonstrating their usage.
3. How do **putch()**, **putchar()**, **puts()**, and string manipulation functions contribute to output operations in C? Provide examples to showcase their usage in manipulating and displaying strings.
4. Define **user-defined functions** in C. Explain the concept of function prototypes and discuss their importance in function declaration and definition.
